

SOLANA HACKATHON · 2026

Crypto Bot

A trend-following autopilot that trades on **Solana** — and proves every decision on-chain.

• Jupiter swaps

• Memo proof journal

• cbBTC · WETH · SOL · USDC

• Self-custody

Live dashboard replaying 2026 on real prices · +20% vs -5% buy & hold

Retail trading bots fail people in three ways

They overtrade

Intraday signals are mostly noise, and fees compound against you on every trade.

We built 7 intraday strategies first — none had an edge after 0.1% fees.

Their track records can't be verified

Screenshots and backtests are easy to cherry-pick. Nobody can prove *when* a decision was made.

Trust today = “take our word for it”.

They want your keys

Custodial bots and exchange API keys put your funds at someone else's risk.

Your money should stay in your wallet.

One slow, rule-based decision a day — executed on Solana, proven on-chain

1

Trend rule

After each daily close, compare the price with its 20, 50, 100 and 200-day averages. The share of averages below the price is the share held in the coin.

4/4 · 100%

2/4 · 50%

0/4 · USDC

2

Solana execution

Swaps USDC ↔ tokens through Jupiter — the best route across every Solana DEX — straight from your own wallet.

 cbBTC

 WETH

 SOL

 USDC

3

Proof-of-Trend

Signals and the trade plan are written to Solana with the Memo program **before** any order executes. Block time can't be backdated.

decide

publish

trade

From a daily candle to a confirmed swap

Fills are booked from on-chain balance changes, not from quotes

No double buys: a lost send is resolved by signature until blockhash expiry

Idempotent daily decision: restarts never trade twice

A track record that **can't be faked**

Timestamped before trading

Each daily decision lands in a Solana block before the bot sends any order.

Anyone can re-check it

Close prices and SMA votes are public data — recompute the signal and compare.

Costs almost nothing

One Memo transaction, ~5,000 lamports (< \$0.001) per day. Works for Binance mode too.

99.5% vs chance

of random entry/exit timings beaten

Binance daily data, 0.1% fee + 0.05% slippage per side, 1,202 trades. BTC + ETH + SOL: +34% a year vs +25% since 2021; +20.0% vs -5.0% in 2026 to date; +3.7% vs -32.2% over the last 12 months. Past performance does not guarantee future results.

Cheap, liquid and verifiable enough to run a strategy on-chain

\$0.04

Round trip for \$500 of BTC via Jupiter

USDC → cbBTC → USDC, measured on Sep 27, 2026 —
vs ≈ \$1.00 at a 0.1% exchange fee per side.

+3.4 pp

More return per year from cheaper execution

Same signals, DEX-level costs: 45.5% vs 42.1% a year in
the backtest (×26.5 vs ×21.6).

< \$0.001

To publish a decision on-chain

One Memo transaction a day makes the whole track
record public and permanent.

Self-custody

BTC, ETH and dollars without an exchange

cbBTC, WETH, SOL and USDC stay in the user's wallet;
the bot only signs swaps.

A calm interface for people — full detail for experts

Advanced mode. SMA signals per asset, equity & drawdown charts, decision journal, live system log.

EnglishРусскийՀայերեն

Screens: the app running a replay of the strategy on real prices, Jan 1 → Sep 26, 2026 (BTC, ETH, SOL; test-mode fees) — +20% vs −5% for buy & hold.

Simple mode. One button to start: test money, Binance or Solana. Every trade is explained in plain words.

Safety and engineering

Non-custodial

Funds never leave the user's wallet. Real swaps need an explicit `BOT_ALLOW_SOLANA_REAL` flag.

Risk-free simulation

Live Jupiter quotes, routes and price impact — without sending a single transaction.

Exact accounting

Fills come from confirmed transaction balance deltas, not from the quote.

Auto-protection

Sells everything and stops if capital falls below a chosen threshold.

170+ automated tests

Swaps on a simulated RPC, blockhash expiry, lost sends, memo size limits, 3 languages.

Diagnostics built in

Structured journal with operation ids, secrets masked, one-command incident report.

From a personal bot to verifiable on-chain strategies

Crypto Bot

Trend-following you can **verify**.

TRY IT

`npm run start` → Start on
